PHISHING EMAIL DETECTION & AWARENESS SYSTEM

Introduction: Phishing is a cyberattack in which attackers use fake emails to trick people into revealing sensitive information.

Objective: To identify phishing indicators, classify emails, and educate users about email security.

Tools Used

- Microsoft Word
- Email header analyzer
- Browser tools
- Google Safe Browsing

Email Analysis: Three fictional email samples were analyzed.

- Safe-looking: Appointment confirmation with no obvious warning signs.
- Suspicious: Unexpected account verification request.
- Phishing indicators: Urgent account-blocking threat asking the user to click an unknown link.

Common Phishing Indicators

- Suspicious sender address
- Fake or misleading domains
- Unknown links
- Urgent threats
- Requests for passwords or banking information

Prevention Guidelines

1. Verify the sender's email address.
2. Avoid clicking unknown links.
3. Never share passwords or OTPs.
4. Visit official websites directly.
5. Report suspicious emails.
6. Enable two-factor authentication.

Conclusion

Learning to recognize phishing indicators helps users protect personal information and reduce cybersecurity risks.
